                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           found to reduce toxicity (see AAQ51327-Q51334). The invention relates to inmunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51328 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.
The wild-type sequence coding for the A subunit of the cholera toxin (CT-A) (Mekalanos et al., Nature 306, 551 (1983) - see AAQ46 was subjected to site-directed mutagenesis. Certain mutations were
                                                                             Immunogenic detoxified mutant cholera toxin and heat labile toxin - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                    Claim 3; Fig
                                                                                                                                                                                                                                                                                08-JUL-1993

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51329 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.
The wild-type sequence coding for the A subunit of the cholera toxin (CT-A) (Mekalanos et al., Nature 306, 551 (1983) - see A was subjected to site-directed mutagenesis. Certain mutations
                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic detoxified CT-A; cholera vaccine; a protomer A; site-directed mutagenesis; reduced ADP-ribosyltransferase activity; ss.

                                                                                                                                                                          Immunogenic detoxified mutant cholera toxin and heat labil - useful as vaccines against infection by Vibrio cholerae enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  to protect against Vibrio cholerae. Sequence AAQ51330 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.
  The wild-type sequence coding for the A subunit of the cholera toxin (CT-A) (Mekalanos et al., Nature 306, 551 (1983) - see A was subjected to site-directed mutagenesis. Certain mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADP-ribosyltransferase activity; ss.

The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51331 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                135

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51332 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.

The wild-type sequence coding for the A subunit of the cholera toxin (CT-A) (Mekalanos et al., Nature 306, 551 (1983) - see A was subjected to site-directed mutagenesis. Certain mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against vibrio cholerae. Sequence AAQ5133 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.
                                                                          Immunogenic detoxified mutant cholera toxin and heat labile t - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                            WPI;

The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against vibrio cholerae. Sequence AAQ51334 is a combination of the wild-type coding sequence and the mutagenic primer sequence used to introduce the preferred mutation.
This sequence encodes the A subunit of the cholera toxin (CT-A) of Vibrio cholerae. The sequence was published by Mekalanos et Nature 306, 551 (1983). Mutations at selected positions within

                                                                                                                                                                                                                                                                                                                                                                    antibody;
```

This sequence corresponds to the coding region for the A subunit of the cholera toxin, an example of a bacterial ADP-ribosylating toxin. A mutant detoxified form of this protein is used in a parenteral adjuvant composition, which comprises the detoxified protein, at least one selected antigen and optionally a pharmaceutically acceptable (optionally topical) vehicle. The adjuvant composition can be administered

parenterally

in

conjunction

with

least one

```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     seq_name:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cc immunise vertebrate subjects. The adjuvant has the ability to enhance ct the humoral and cell-mediated immune responses elicited by the antigen cc (e.g. by making the antigen more strongly immunogenic or necessitating cc fewer/lower antigen doses). It can be administered prior/subsequent to the antigen, and is preferably administered within a short space of time ct to the same site; it can also be administered in isolation from antigens cas a boost following systemic or nucosal antigen administration. Most corpeterably, the adjuvant is co-administered with the antigen in the compositions and a pharmaceutically acceptable carrier. The antigen may cc be derived from viruses, bacteria, parasites and fungi or may be tumour cantigens, self-antigens and allergens. The compositions are therefore cc useful in the treatment and prevention of e.g. viral diseases, allergic manifestations, diseases caused by pathogens (e.g. bacteria or cc parasites), Alzheimer's disease (e.g. Systemic Lupus cc parasites), Alzheimer's disease and cancers. The adjuvant can also be used to prepare antibodies against selected antigen(s), useful cc e.g. for diagnostic purposes or for antigen purification.

The sequence has no cryptic signal sequence and no CG (potential methylation sites) sequences. Novel polynucleotides encode a mutant Escherichia coli heat-labile toxin (LT) subunit A (LT-A) polypeptide or a mutant V. cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CTB subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                189

Novel polynucleotides encode a mutant Escherichia coli heat labile toxin (LT) subunit A (LT-A) polypeptide or a mutant V. cholerae cholera toxin (CT) & subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the production of the production of transgenic plants for the production of the production of transgenic plants for the production of transgenic plants for the production of transgenic plants for the production of the production of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC Vibrio cholerae cholera toxin (CT) A subunit (CT-A) having a A72R CC vibrio cholerae cholerae toxin (CT) A subunit (CT-A) having a A72R CC substitution. The sequence has no cryptic signal sequence and no CG CC (potential methylation sites) sequences. Novel polynucleotides encode a CC mutant Escherichia coli heat-labile toxin (LT) subunit A (LT-A) CC polypeptide or a mutant V. cholerae cholera toxin (CT) A subunit (CT-A) CC polypeptide, which have reduced enzyme activity as compared to the CC wild-type LT-A or CT-A polypeptide and where at least one of the codons CC is altered to a plant preferred codon. The polynucleotide further CC comprises a nucleic acid sequence encoding LTB subunit (LT-B) or a CT-B CC subunit (CT-B). The polynucleotides are useful for the transformation of CC plant cells for the production of transgenic plants for the CC vaccines, especially oral vaccines in transgenic plants for the CC prophylactic or therapeutic treatment against E. coli or V. cholerae. The CC mutant polypeptides are also useful as adjuvants.

                                                                                                                                                                                                                                                                            Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                        (potential methylation sites) sequences. Novel polynucleotides encode a mutant Escherichia coli heat-labile toxin (LT) subunit A (LT-A) polypeptide or a mutant V. cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT E subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This plant-codon optimized cDNA encodes a mutant synthetic Vibrio cholerae cholera toxin (CT) A subunit (CT-A) having substitution. The sequence has no cryptic signal sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDS

                                                                                                                                                                                                                                                                                                                    enterotoxin which has been mutated to provide A subunit. A composition of matter comprising the chimeric molecule in a pharmaceutically acceptable carrier is useful for obtaining enhanced immune response of an organism to an antigen by administering it to the antigen. The chimeric molecule is useful to provide specific immune reasonees to
                                                                                                                                                                                                                                                     is useful to provide specific immune response to a particular enterotoxin, as adjuvants for use with unrelated vaccines, and to customize adjuvants to direct production of cell-mediated or humoral
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides a chimeric molecule that comprises a first subunit which is mutated A subunit of first enterotoxin and a second non-mutated subunit from a second enterotoxin which is different from the natural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chimeric molecule useful as adjuvant for cell-mediated/humoral immunity comprises first mutated A subunit of first enterotoxin and second non-mutated subunit from second enterotoxin different from natural

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Percent Similarity: 100.000
                                                                                                        therapeutically treating an animal with a therapeutic agent encoded by polynucleotide coding sequence, by transfecting the animal with a bacterial bleb containing a eukaryotic expression cassette including the polynucleotide coding sequence. The method can be used for introducing endogenous or foreign genes into animal cells using bacterial blebs as vectors. The method allows for the delivery of eukaryotic expression
                                                                                                                                                                                                                                                            The present invention also describes: (1) a bacterial bleb containing a eukaryotic expression cassette; (2) a transformed animal cell including a bacterial bleb, or a transfected product of the bacterial bleb;
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Introducing and expressing a gene in animal cells, useful for delivering a therapeutic agent to the cells, comprises infecting animal cells with bacterial blebs containing a eukaryotic expression cassette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    689 GAGTACTTTGACCGAGGTACTCAAATGAATATCAACCTTTATGATCATGC
containing the eukaryotic expression cassette can also animal cells cultured in vitro. The method can be used
                                 therapeutic agents, immunoregulatory agents, antisense RNAs, a catalytic RNAs in animal cells or tissues. The bacterial blebs
                                                      cassettes encoding the endogenous or foreign genes into animal cells or tissues, and is useful for expressing e.g. vaccine antigens, gene therapeutic agents, immunoregulatory agents, antisense RNAs, and
                                                                                                                                                                                                                                                                                                                    a gene in animal cells, comprising infecting animal cells with bacte blebs containing a eukaryotic expression cassette encoding the gene.
                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for introducing and expressing a qene in animal cells, comprising infecting animal cells with bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cholera toxin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cholera toxin Al subunit sequence SEQ ID NO:1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            739

therapy

SSSSS

The present sequence represents the cholera toxin Al subunit sequence, which is used in an example from the present invention for the product of non-pyrogenic blebs containing a DNA vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence comprises the Vibrio cholerae gene that encodes CC cholera toxin (see AAW25785). DNA encoding an enzymatically active Al fragment of the cholera toxin was used to construct a cholera CC toxin Al-diphtheria toxin B'-interleukin-2 (CTA-DTB-IL2) gene that CC was expressed in E. coli. The hybrid protein can be isolated and CC used e.g. as an adjunct to treatment with DTB-IL2 hybrid, which CC targets the cell-killing ability of diphtheria toxin to cells CC bearing the IL2 receptor, such as certain leukaemic T cells. Prior application of the CTA-DTB-IL2 hybrid alleviates the CC prior application of the CTA-DTB-IL2 hybrid alleviates the CC problem of endogenous IL2 competing with DTB-IL2 hybrid for IL2 creceptors on T cells. Claimed hybrid proteins comprise a cc translocation domain and a cell binding domain from e.g. a hormone, CC growth factor or polypeptide toxin. The hybrid molecules can be CC used for the delivery of agents (e.g. therapeutic genes, toxins, CC detectable labels) into cells. The use of a translocation cc detectable labels) into cells. The use of a translocation cc mechanism ensures that the hybrid will be effective in relatively CC low doses, since a high proportion of the substance of interest CC will be taken into the targeted cells. The hybrid molecules can be CC manufactured as a single hybrid recombinant protein, permitting CC composition.

```
CC protein comprising three parts: (a) the first part comprises a portion of the binding domain of a cell-binding polypeptide ligand allowing the CC hybrid protein to bind to an animal cell; (b) the second part comprises a portion of a translocation domain of a naturally occurring protein cc selected from diphtheria toxin, botulinum neurotoxin, ricin, cholera CC toxin, which translocate the third part of the across thoxin and tetanus cc toxin, which translocate the third part of the across the cytoplasmic cc membrane into the cytosol of the cell; and (c) the third part comprises cc a polypeptide entity to be introduced into the cell, which is non-native cc to the naturally occurring protein of (b). This sequence represents the cytorio cholerae toxin Al fragment gene for use in generating the hybrid co fit he invention. The hybrid molecule enables the direction of compropriate therapy to affected cells, allowing them to function properly cand allowing enetic deficiency diseases. The hybrid is especially used in creating genetic deficiency diseases, by delivering to affected cells an enzyme supplying the missing function, to supplementing cellular clavels of a particular enzyme or a scarce precursor or cofactor, to calipocytes, cancer cell, or virus infected-cells), to counteracting viral confections such as HIV, by introducing appropriate antibodies to viral constrainces such as detectable labels into cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                25-APR-1985;

```

```
CC translocation domain of a naturally occurring protein (e.g. the CC translocation domain of diphtheria toxin) the second part translocates CC the third part across the cytoplasmic membrane and into the cytosol of CC the cell. The third part comprises a chemical entity to be introduced CC into the cell, where each of the first and third part is non-native with CC respect to naturally occurring protein, and the covalent bond attaching CC the second and third part is cleavable. The toxin encoded by the present CC sequence can form part of the third portion of the hybrid protein. The CC cell binding domain binds to a specific cell and the translocation domain transfers the hybrid molecule across the cell membrane into the cytosol. CC The third part of the protein, linked to the translocation domain through care useful for treating genetic deficiency diseases by delivering to affected cells an enzyme supplying the missing function, to supplement CC cellular levels of a particular enzyme or a scarce precursor or cofactor, to direct toxins or other poisons to destroy particular cells (such as content cells, cancer cells, or virus-infected cells), and to counteract
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq_documentation_block:

                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents the Vibrio cholerae toxin gene. The toxin be included in the hybrid protein of the invention and used to de modify the cell that the hybrid protein is targeted to. The hybrid protein comprises a first part which is a portion of the binding of a cell-binding ligand, effective to cause the hybrid molecule to a cell of an animal. The second part comprises a portion of the content of the cell of an animal of the second part comprises a portion of the cell of an animal of the second part comprises a portion of the cell of an animal of the second part comprises a portion of the cell of an animal of the cell of an animal of the cell of the cell of an animal of the cell of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cholera toxin; hybrid protein; translocation genetic deficiency disease; cell targetting; adipocyte; enzyme delivery; anti-viral; HIV;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vibrio cholerae toxin gene

AAQ51327 standard;
toxin (CT-A) (Mekalanos et al., Nature 306, 551 (1983) - see AAQ46318; was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAQ51327-Q51334). The invention relates to immunogenic, detoxified CT-A proteins and their use in vaccines to protect against Vibrio cholerae. Sequence AAQ51327 is a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 rdean@clemson.edu
                                                                                                                                                                                                                                                                                                                                                                                                                                           Rice blast is one of the most devestating fungal diseases of rice world wide. It is a filamentous ascomycete with a haploid genome (n-7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25x genome coverage. High density colony filters are available upon request."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.005 inch orifice at constant velocity. The sheared DN was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from: 1

/note="Vector: pZero-2 (Invitrogen); Site_1: EcoRV;
Genomic DNA was isolated from stationary phase cells. For
this library, DNA was sheared to give a tight size
distribution of 1-1.5kb fragments, blunt-ended with T4 DNA
polymerase, dephosphorylated with Shrimp Alkaline
phosphatase and ligated into pZero-2 vector's EcoRV site."
